LiveLoad

# LiveLoad

---

**LiveLoad** is a hardware solution uniquely developed by Adventum Tech that monitors loadbearing of temporary and permanent supports. LiveLoad sensor system tasks are:

- to monitor overall loadbearing of the structure
- to detect overloaded supports eliminating any risk of further deformation, deflection or even collapse
- to record total weight of reinforcement and concrete applied in the structure
- to record the progression of reinforced concrete structure's development
- to increase safety and transparency of erecting superstructure's behavior
